

Doing 0→1

My Tips and Tricks

About me

13+ years of experience in software engineering

3+ years as an Organization Manager

Getting ****it Done** in the most Valuable private tech company in Europe

Ex Head of iOS Practice East UA

Scrum master, Solution Architect, Software Engineering Manager,
Polyglot Engineer

Creator of iOS educational programs for junior/ middle/ senior levels

Illia Kucheriavyi

Disclaimer

This presentation reflects my personal experience and opinions. It is not affiliated with, endorsed by, or representative of any current or former employer or company.

All examples are shared for educational purposes only.

Disclaimer #2

The principles and examples shared in this presentation are broadly applicable and may be adapted to various contexts, including personal life, career development, and teamwork. Interpret and apply them based on your own situation and judgment.

The Productivity Paradox

Busy $\neq$ Productive

Teams shipping more features
but achieving less impact

Strategy First: Speed vs. Direction

Moving fast in the wrong direction is
waste

The compound returns of thinking first

Two Questions That Matter

What to build?

Everyone asks this

What NOT to build?

This is harder and more
valuable

Subtraction Audit Exercise

What could you remove from your current sprint/ work/ life?

- Refactoring a feature being removed next quarter
 - That meeting with no decisions
 - Updating UI screen ignored by users

Three Lenses for Decisions

Is this about...

Value

Does it matter to users?

Risk

Does it reduce uncertainty?

Learning

Does it teach us something critical?

Quick Prioritization in Practice

ICE

Impact $\times$ Confidence $\div$ Effort
Score in 5 minutes

2x2 Matrix

Impact vs. Effort
Visual quadrants

Unlocking

"What does this enable?"
Cascading value

Example comparison:

Infrastructure work that unblocks 3 teams vs. Small UI polish

Are You Building or Validating?

Shipping vs. learning need different approaches

Know which one you're doing right now

The MVP Spectrum

Match your effort to your uncertainty

- Throwaway spike — Test the approach
- Prototype — Show stakeholders
- Beta — Ship to select users

Testing payment flow with a fake button vs. building full payment integration

Build → Test → Scrap

The prototype you throw away
teaches you what to build

Spending 3 hours testing 3 approaches, scrapping all code,
then building the right solution in 2 hours

The 7 Wastes for Practitioners

Half-done work

Overengineering

Relearning

Context switching

Waiting

Handoffs

Defects

Finish Before Starting

The hidden cost of Work in Progress

High WIP

- 5 tasks in progress
- Constant context switching
- Nothing ships this week
- Team blocked waiting
- Stale reviews pile up

Limited WIP

- 2 tasks in progress
- Deep focus on each
- 2 features shipped
- Value delivered
- Fast feedback loops

Rule: Close 2 tasks before opening a 3rd

Automate at 3+

Done it manually 3 times?
Automate it now

- Deployment checklist → script
- Manual testing → automated suite
- Copy-paste setup → template

Make Knowledge Explicit

Document as you go, pair on complex work

"Why did we choose this database?"

Lives in someone's head

vs.

Written decision record

Onboarding: 2 weeks → 2 days

Fast Feedback Loops

Shorter cycles = less waste

- Waiting 2 days for staging deploy vs. testing locally in 5 minutes
- Quarterly reviews vs. weekly check-ins

Using AI Strategically

LLMs for boilerplate, test cases,
documentation, initial research

Keep your brain for architecture and decisions

AI Anti-patterns

- Don't ship what you don't understand
- Don't skip thinking
- Validate everything

Blindly accepting AI refactor that breaks edge cases

Using AI to write requirements instead of understanding users

Identify Your Personal Waste

What's your pattern?

- Attending meetings where you're silent
 - Perfectionism on low-impact work
 - Rewriting things that work fine
 - Tool experimentation without goal

Monday Morning Checklist

- Think before building
- Automate repetition
- Finish before starting
- Validate cheaply
- Pair on hard problems
- AI for grunt work

The Compound Effect

Small improvements stack

Eliminating waste today
makes tomorrow faster

Never settle

Case Study

Real example:

Team eliminated 40% of backlog

Shipped core feature 2 sprints early

Learned their riskiest assumption was wrong before building

Subtraction + Validation + Waste Elimination

Key Takeaways

- **Think first** — Direction beats speed
- **Subtract ruthlessly** — What NOT to build matters most
- **Finish before starting** — Limit WIP
- **Automate at 3+** — Eliminate repeated waste
- **Build → Test → Scrap** — Learn cheap, ship right

Thank you
